## Contents

1	Exercises 1	2
2	Exercises 2	2
3	Exercises 3	2
4	Exercises 4	3
5	Exercises 5	3
6	Exercises 6	4

#### 1 Exercises 1

Write a C expression that will yield a word consisting of the least significant byte of x and the remaining bytes of y.

For operands x = 0x89ABCDEF and y = 0x76543210, this would give 0x765432EF.

Answer:

```
/* * C expression yeild the least significant byte of x * and the remaining bytes of y */
```

### 2 Exercises 2

Write code for a function with the following prototype:

Answer:

```
/*
 * Mask with least significant n bits set to 1
 * Examples: n = 6 -> 0x3F, n = 17 -->0x1FFFF
 * Assume int is w bits long; 1 <= n <= w;
 */
int lower_one_mask(int n):
{</pre>
```

### 3 Exercises 3

Assume that your student ID is a 32-bit integer number. Write the bit sequence of that number in binary. With the same sequence, what is the value (in decimal) if we interpret it as a a) sign-magnitude, b) two's complement?, c) Single precision float

Answer:

Student ID	1450000
Binary	?
Sign-and-magnitude	?
Two's complement	?
Single precision float	?

Table 1: Different interpretation

### 4 Exercises 4

We are running programs on a machine where values of type int are 32 bits. They are represented in two's complement, and they are right shifted arithmetically. Values of type unsigned are also 32 bits.

We generate arbitrary values **x** and **y**, and convert them to unsigned values as follows:

```
/* Create some arbitrary values */
int x = random();
int y = random();
/* Convert to unsigned */
unsigned ux = (unsigned) x;
unsigned uy = (unsigned) y;
```

For each of the following C expressions, you are to indicate whether or not the expression always yields 1.

```
4A. (x<y) == (-x>-y)

4B. ((x+y)<<4) + y-x == 17*y+15*x

4C. ~x+~y+1 == ~(x+y)

4D. (ux-uy) == -(unsigned)(y-x)

4E. ((x >> 2) << 2) <= x
```

#### Answer:

C expressions	Yes/No
4A	?
4B	?
4C	?
4D	?
4E	?

#### 5 Exercises 5

We are running programs on a machine where values of type int have a 32-bit two's-complement representation. Values of type float use the 32-bit IEEE format, and values of type double use the 64-bit IEEE format.

We generate arbitrary integer values x, y, and z, and convert them to values of type double as follows:

```
/* Create some arbitrary values */
int x = random();
int y = random();
int z = random();
/* Convert to double */
double dx = (double) x;
double dy = (double) y;
double dz = (double) z;
```

For each of the following C expressions, you are to indicate whether or not the expression always yields 1. Note that you cannot use an IA32 machine running gcc to test your answers, since it would use the 80-bit extended-precision representation for both float and double.

```
5A. (float) x == (float) dx

5B. dx - dy == (double) (x-y)

5C. (dx + dy) + dz == dx + (dy + dz)

5D. (dx * dy) * dz == dx * (dy * dz)

5E. dx / dx == dz / dz
```

#### Answer:

C expressions	Yes/No
A	?
В	?
С	?
D	?
Е	?

### 6 Exercises 6

Consider a 16-bit floating-point representation based on the IEEE floating-point format, with 1 sign bit, 5 exponent bits (k = 5), and 10 fraction bits (k = 10). The exponent bias is  $2^{5-1} - 1 = 15$ .

Fill in the table that follows for each of the numbers given, with the following instructions for each column:

- Hex: The four hexadecimal digits describing the encoded form.
- M: The value of the significand. This should be a number of the form x or  $\frac{x}{y}$ , where x is an integer, and y is an integral power of 2. Examples include:  $0, \frac{67}{64}$ , and  $\frac{1}{256}$ .
- E: The integer value of the exponent.
- V: The numeric value represented. Use the notation x or  $x \times 2^z$ , where x and z are integers.

Description	Hex	M	E	V
-0	8000		-14	-0
Smallest value $> 2$	4001	$\frac{1025}{1024}$		$1025 * 2^{-9}$
512	6000			512
Largest denormalized	03FF			
Number with hex representation 3BB0	3BB0
